

March 4, 2010

Dear Customer

We would like to take this opportunity to thank you for your continued support of Lantheus Medical Imaging. Together, we have made a positive impact in maintaining patient access to critical medical isotopes.

The planned shutdown of the High-Flux Reactor (HFR) in the Netherlands began on February 19, 2010¹ and the National Research Universal (NRU) reactor in Canada is not expected to be back on line until the end of April 2010.² Although this additional delay in the start up of the NRU reactor is disappointing, we are confident that it will come back to service.

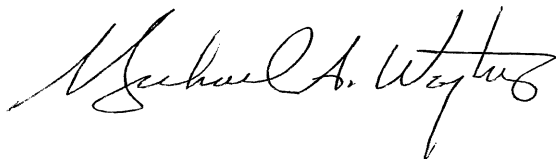

Our supply of Mo99 during March 21st through March 25th will be significantly lower due to maintenance cycles at the remaining operating reactors. We will continue to actively manage the limited supply available to meet your most pressing needs. Clarity on available Mo99 supply for the month of April is still being determined, although we do expect it to be consistent with our Mo99 supply level for February and March of this year. We will continue to provide frequent communications on our website as more specific Mo99 supply updates become available.

We continue to actively work with our Mo99 Suppliers to maximize the supply of Mo99 for our Customers and the Medical Imaging community. Our suppliers are doing everything they can to support us so that we can meet your needs. In addition, the BR2 reactor in Belgium and Osiris reactor in France are expected to help contribute Mo99 supply from February 19 through the end of April.

Lantheus remains focused on establishing a diverse supply for Mo99 that will serve the near term and future needs for our nuclear medicine providers and patients. We realize the impact this shortage has on you and your patients, and we at Lantheus are committed to doing everything possible to secure more Mo99 supply.

We will continue to provide additional information on our supply on Mo99, and we encourage you to sign up on our website at www.lantheus.com.

Sincerely,

Michael A. Wojtas
